Abstract A list of Hepaticae and Anthocerotae made from the northern Mariana Islands, Micronesia, is presented. Fifty-eight taxa of Hepaticae and three taxa of Anthocerotae are recognized, including eight unidentified ones. Localities, habitat and representative specimens examined are provided for each species.

Key words: Hepaticae, Anthocerotae, northern Mariana Islands.

The Natural History Museum and Institute, Chiba, is conducting a research project on the Izu-Mariana Archipelago in order to understand the origin and evolution of the fauna and flora. The museum organized an expedition to the northern Mariana Islands in cooperation with the Department of Natural Resources (Commonwealth of the Northern Mariana Islands) and the University of Guam Marine Laboratory between 10 May and 10 June 1992. As a member of the group, I was able to study the bryophytes and collected about 800 specimens during the expedition. These included about 600 specimens of Hepaticae and Anthocerotae and a tentative list is presented here.

Study Sites

The northern Mariana Islands consist of the small, younger volcanic islands, lying north and south between 13°20'N and 20°40'E between the Volcano Islands (Minami-Iwou etc.) and the southern Mariana Islands (Saipan etc.). The party visited nine of the islands: Uracas, Maug, Asuncion, Agrihan, Pagan, Alamagan, Guguan, Sarigan and Anatahan (Fig. 1), and stayed at each island between one and six days. The sites studied were located along route a–t as mentioned below. Most specimens were collected by myself except for those collected by Dr. H. Harada along route i of Agrihan Is.

Enumeration of species

The arrangement of families and of genera in each family follows Grolle (1983). Each species name is followed by the localities, which are arranged from north to south, habitat, and the representative specimen(s) examined. All specimens are deposited in the herbarium of the Natural History Museum and Institute, Chiba (CBM).

This has not been reported from the Mariana Islands except for Guam. The complex of *Radula javanica* varies widely in leaf lobules and leaf shape. Well-developed plants of *R. javanica* rarely resemble *R. cordiloba*, known only from Nightingale I. in the Pacific Ocean, but I think the appearance of *R. cordiloba* places it in the category of variations shows by *R. javanica*.
