Abstract Thirty-three subspecies which belonging to 32 species and six families of butterflies (Lepidoptera) are recorded from the Kamchatka Peninsula and North Kuril Islands, based on material collected during the Biological Expedition to the Kamchatka Peninsula and North Kuril Islands in 1996 and 1997. Two subspecies, *Colias tyche relicta* Kurentzov, 1970 and *Oeneis norma chione* Austaut, 1911 are newly recorded from the Kamchatca Peninsula.

Key words: butterflies, Lepidoptera, Kamchatka Peninsula, Kuril Islands.

Alphéraky (1897) recorded 26 species of butterflies from the Kamchatka Peninsula for the first time. Kurentzov (1963, 1966) reported data on the butterfly fauna of the Kamchatka Peninsula based on the samples collected during 1958–1960 and Kurentzov (1970) discussed the distribution and variation of local populations of 39 Kamchatian species. Tuzov (1993) and Korshunov (1995) listed 37 and 50 species of butterflies from the Kamchatka Peninsula, respectively. Recently, Yazaki (1995) reported four species from Mt. Klyuchevskaya, and Ikezawa (1996) listed 15 species collected during his trip to the Kamchatka Peninsula.

There are very few records of the butterflies of the North Kuril Islands. Matsumura (1927a, b) described *Argynnis selene chibiana*, and *Lycaena optilete kurilensis* as a new subspecies based on the materials collected by K. Doi in 1926 and 1927, and Esaki (1933) reported two species from the North Kuril Islands, collected by K. Koba and K. Okada in 1931.

The Biological Expedition to the Kamchatka Peninsula and North Kuril Islands of the Natural History Museum and Institute, Chiba, was carried out in 1996 and 1997. It was a part of a project entitled "The Origin

and Biogeography of the Northeast Asian Biota," in co-operation with the Institute of Biology and Pedology and the Institute of Marine Biology belonging to the Far Eastern Branch of the Russian Academy of Sciences, Vladivostok.

In the present paper, a list of the butterflies is presented based on the material collected during the expedition.

Materials and Methods

Specimens were collected at 22 sites on the Kamchatka Peninsula, during the periods 3rd to 17th July 1996, 7th to 10th July 1997 and 27th July to 5th August 1997. On the North Kuril Islands, butterflies were collected at seven sites on Paramushir Island and one site from Shumshu Island, during the periods 11th to 24th July 1997. The sampling localities are shown in Figs. 1 and 2 and detailed information is given below.
